RideRent Pro: Week 7 Weekly Development Update of a Centralized Vehicle Rental Platform

Abstract— This report presents the development progress completed during Week 7 of the RideRent Pro project, prepared by Abdul Ahad. During this phase, the team focused on establishing the modular repository directory structure, implementing secure password-hashed login authentication, developing the dedicated Admin Panel interface with reusable UI layout components, configuring Git feature branching, and staging the pull request for main branch integration. The system is prepared for feature branch merging and multi-developer workflow expansion.

I. INTRODUCTION

RideRent Pro is a centralized vehicle rental management system developed using PHP, MySQL, Bootstrap, HTML, CSS, and JavaScript. Week 7 focused on establishing the core administrative infrastructure, database connection handling, session management, user authentication security, modular layout templates, and Git feature-branching workflows.

Modular Repository Structure → User Input & Session Logic → PHP Processing / Password Hashing → MySQL Database Connection

II. WEEK 7 DEVELOPMENT PROGRESS

Completed Directory Structure Setup (RideRent_Final), Database Connection Engine, Session Management & Password Hashing, Admin Dashboard Development, Modular Layout Components, Readme Documentation, and GitHub Feature Branching (Feature-Omima-Admin-Login-Authentication).

III. IMPLEMENTATION STRUCTURE

The Week 7 implementation follows a modular structure in which user input and session logic are processed through PHP, with password hashing and verification handled securely before interaction with the MySQL database. The administrative interface is organized using reusable layout components.

Fig. 1. Week 7 implementation flow.

IV. COMPLETED DEVELOPMENT TASKS

1	RideRent_Final Directory Setup
2	Database Connectivity (config/database.php)
3	Password Hashing & Verification
4	Active Session Management
5	Secure Logout Operations
6	Admin Dashboard (admin/dashboard.php)
7	Modular Layout Integration (includes/)

8	User Interface Styling
9	Documentation Updates (Readme.md)
10	Video Asset Organization
11	Git Branch Staging for Pull Request

V. GROUP CONTRIBUTIONS

Member	Contribution
Abdul Ahad	Prepared Week 7 development progress report, contributed to administrative UI components, client-side validation logic, database schema integration, and module verification.
Ornima Hafizur	Spearheaded directory architecture (RideRent_Final), database connection handling, login authentication with password hashing, session control, admin dashboard (dashboard.php), modular layout templates (includes/), documentation (Readme.md), and feature branch management.
Md. Shihabur Rahman Shihab	Assisted with secondary research, workflow verification, and non-file-based development activities.
Anisha Zaman	Contributed to solution documentation, database connection verification, and UI layout review.

VI. CURRENT IMPLEMENTATION STATUS

Component	Status
Core Repository Directory Structure (RideRent_Final)	Completed
MySQL Database Connection (config/database.php)	Completed
Session Management & Password Hashing	Completed
Admin Dashboard UI & Logic (admin/dashboard.php)	Completed
Modular Layout Components (header, footer, sidebar)	Completed
Repository Documentation & Video Asset Structure	Completed
GitHub Branching & Workflow Control	Completed
Feature Branch Pull Request Staging	Active / Pending Merge
Team Branch Integration & Multi-Developer Onboarding	Ongoing
Full Application Integration Testing (XAMPP Localhost)	Upcoming

VII. PROJECT STATUS

The Admin Panel and Login Authentication module is fully developed, staged on a dedicated feature branch, and ready for merging into the main branch to support multi-developer module integration.

VIII. CONCLUSION

Week 7 successfully established the foundational architecture, secure authentication engine, administrative UI, and branch control strategy for RideRent Pro. The immediate next steps involve executing the active pull request to merge the feature branch into main, guiding team members to branch off the updated repository structure, and conducting end-to-end local system testing (via XAMPP) prior to final presentation.
